Evaluation and improvement of fine-grained image classification by deep learning

Laboratory of Intelligent Software

Fine-grained image classification

Fine-grained image classification is a challenging task due to the large intra-class variance and small inter-class variance, aiming at recognizing hundreds of sub-categories belonging to the same basic-level category.

Deep Learning

The Xception model has good generalization ability in fine-grained image classification. This study attempts to use the Xception model and the triplet loss function to the fine-grained image classification task.
